Applications, Suitable Fluids

Applications

Centrifuge construction,
Coating machines, Compressors
Engine construction
Filling stations, Filter systems
Generator construction
Heat transfer systems, Heavy electrical machines
Lubricant manufacturers, Lubricating oil systems
Machine-building industry, Machine tools,
Manufacture of apparatus,
Marine engine construction,
Metal-forming machines, Metering systems
Paint industry, Plain metal bearing production,
Printing machines, PUR machinery
Refrigerators, Rubber and tire manufacturing
Tank plant construction,
Transmission building
Turbine construction
Vacuum machinery
Waste oil - disposal
 - transport
 - treatment

Suitable fluids

Adhesives, Antifreeze
Bore oils
Cutting oils
Diesel oils, Drawing compound
Emulsions
Fuel oils, L, EL, H
Gear oils, Grease
Hardening oils, Heat transfer media,
Heavy oils, Hydraulic fluids
Isocyanate
Lubricating oils, Lacquers
Motor oils
Paint, Paraffins, Plastics, Polyols
Printing inks, Processing oils
Resins, Rolling oils
Waste oils, Waxes

Construction

Function

KF gear pumps are used for pumping a wide variety of fluids.

KF gear pumps are distinguished especially by their wide range of variants which are assembled as required on the modular principle and also permit subsequent upgrade.

The pumps are also suitable for media with low lubricating properties.

The standard housing sections are of grey cast iron. The gear units are manufactured from high strength case hardening steel, hardened and mounted in special multicomponent plain bearing bushes.

The standard drive shaft is sealed by rotary shaft lip type seal.

All pump sizes incorporate helical tooth system. This feature, combined with special gear geometry, results in extremely low noise levels and reduced pressure pulsation.

Working Notes

- The fluids should ensure a certain minimum lubricating properties, should not contain solids and should be chemically compatible.
- Avoid dry operation.
- The pumps may only be operated in the specified direction of rotation, as otherwise the shaft seal will be destroyed.
- In order to prevent excessive overpressure, a safety valve should be provided in the system or on the pump.
- The pressure relief valve attached to the pump may only be used as safety valve for short-term operation.
- A separate pressure relief valve with return line to the reservoir must be foreseen, if a partial discharge flow has to be drained over a prolonged period.

Variants

- Sealing of the drive shaft:
 - Rotary shaft lip-type seal
 - Double rotary shaft lip-type seal (Quench)
 - Mechanical seal
- Outboard bearing to take up input drive-side radial load
- Pressure relief valve for pump and system
- Uniform discharge flow direction with changing direction of rotation by means of flange-mounting valve combination (universal device).

Special Design

To meet your individual requirements on request special constructions are available: for instance mounting flange models, various types of plane bearings, etc. Our Sales engineers will be pleased to advise you.

Accessories

Connecting flange 4-bolt type	Foot mounting flanges for the adaptor flanges below
Mounting angles	Base plates
Pressure relief valves (attachable subsequently)	Couplings
	Adaptor flanges (pump carrier)

Other Types

Pump with electric motor directly connected to each other by an adaptor flange.

Kinematic viscosity ν mm²/s

< 300 300 500 1000 2000 3000 6000 10000 20000 30000

1500 1250 1000 750 600 500 400 300 200 100

Speed $n_{\max}$ 1/min

Note

The above specified minimum and maximum characteristics are NOT applicable for some specific working conditions: maximum working pressure is NOT permissible in conjunction with low speeds and low viscosities. Please contact us whenever such critical ranges are encountered.

Direction of Rotation

The following should be note for direction of rotation:

- when looking at the pump shaft end, the direction of pumping is from left to right if the shaft rotates **clockwise**.
- when looking at the pump shaft end, the direction of pumping is from right to left if the shaft rotates **counterclockwise**.

With pressure relief valve

ATEX Design

	KF 3/100...6/730 with lip-type seal	KF 3/100...6/730 with double lip-type seal
In Ex-area max. suitable for category	EX II 2G T4 EX II 2D T135 °C	EX II 2G T4

Pipe connection			flanged pipe connections, 4-bolt type (straight flange couplings, welding connectors, in addition Intermediate flange heatable), threaded ports	
Working pressures Inlet port	standard	p _{e min}	– 0.4 bar (Vacuum) for short time duty e.g. when starting: down to – 0.6 bar are permissible, observe the limitation of p _{e min} for pumps with Universal Arrangement	
		p _{e max}	0.5 bar for PTFE rotary shaft lip type seals 1.0 bar for NBR- and FKM rotary shaft lip type seals 10 bar for mechanical seals	
	309	p _{e min}	– 0.9 bar	
		p _{e max}	0.2 bar	
	196	p _{e min}	– 0.4 bar, Starting condition – 0.6 bar	
		p _{e max}	25 bar	
	197	p _{e min}	– 0.4 bar, Starting condition – 0.6 bar	
		p _{e max}	1 bar	
Working pressure Outlet port		P _n	25 bar*	
Speed		n _{min}	200 1/min	
		n _{max}	2000 1/mn The permissible max. speed depends upon the viscosity of the medium operated acc. to the table on page 10	
Viscosity		v _{min}	12 mm²/s	
		v _{max}	15000 mm²/s (Viscosities other than within this range on request)	
Weight		kg	see dimensional sheets	
Fluid temperature		ϑ _{m min}	– 10 °C	
		ϑ _{m max}	90 °C for NBR rotary shaft lip type seals 150 °C for FKM rotary shaft lip type seals and mechanical seals SAVGG 200 °C for PTFE rotary shaft lipv type seals 200 °C for mechanical Seals SATGG or ord. code refer to p. 11	
Ambient temperature		ϑ _{m min}	– 20 °C	
		ϑ _{m max}	+ 60 °C	
Low temperature			on request	
Filter			Filter fineness ≤ 60 μm	

* higher pressures only with prior consent from Kracht GmbH

General

The noise optimized pumps of the KF Series are primarily designed for the transport of mediums with an increased share of air, whereby both normal operation and vacuum operation are possible. In applications with no air content in the medium, this type of utilization is not advisable since in such case the noise reduction does not take effect. In these cases, the targeted application of noise reduction elements and also flexible hoses are recommended for achieving noise reduction. Our Sales Engineers are happy to advise you!

The following illustrations show the construction of the KF models described on Page 9. Models **196** and **197** are designed for the transport of air-content transmission oils, therefore for application as a lubricating oil pump in ship gears and stationary gears. Special construction measures prevent the otherwise normal noise increase associated with air-content transmission oils and high degrees of negative pressure. The noise levels do not exceed or only negligibly exceed the measurement valued with non-aircontent oils. A shift in the noise spectrum to higher, unpleasant frequencies also does not occur.

Pumps with the special code **197** are built as mounted pumps or pumps in combination with an electronic motor. The mounted pump (Fig. 1) is equipped with an outboard bearing for the absorption of radial forces like the type that appear when using a floating pinion. The pump in combination with an electronic motor (Fig. 2) has no outboard bearing and must be driven by means of a flexible coupling. Mounted pump and electronic motor are sealed at the shaft end by a rotary shaft seal.

The pumps with the special code **196** are built as mounted pumps both with (Fig. 3) and without an outboard bearing. This model has no seal at the shaft end, making it possible to operate it with pressure on the suction side. The accruing leakage oil is fed off into the gear space. The pumps with the special code **309** (Fig. 4) are designed for deployment in vacuum facilities for the degassing and cleaning of oils. These pumps are built as pumps in combination with an electronic motor and have no outboard bearing for the absorption of external radial forces. At this version, a triple sealing with quench is used as shaft sealing. The middle shaft sealing is mounted for suction operation.

Discharge flow Q in l/min

Power input required P in kW

The dispersion of discharge flow Q as specified in the above table may be: Q + 10 % up to - 5 %.
At viscosities of ν < 30 mm²/s reduction of the discharge flow Q. At viscosities of ν > 300 mm²/s, the speed must be reduced.
The drive motor output must be selected 20 % higher than the data for P as specified in the above table.
For viscosities of ν > 100 mm²/s the power input must be increased. The values count to oils without share of air.

Type Key KF-Coupling

Ordering example

R.* 38 - Z 45/38 - Z 45/38

Coupling size

Pump side
cylindrical

coupling hub length and hub bore

Motor side
cylindrical

.*	Hub material
A	AL
G	GG

Working temperature:
– 10 °C to + 80 °C
(short-time temperature peaks
up to + 120 °C are permissible)

Weights as well as moments of inertia relate to the
max. bore dia. after final machining – but without key way.
Bore finish acc. to ISO – fit, class H7;
Key-ways acc. to DIN 6885 / part 1

Flange Type Pumps with Mounting Angle

Materials

Housing: Cast iron with lamellar graphite acc. to DIN 1691

Shafts and gears: Case hardening steel acc. to DIN 17210 surface hardened and grinded

Mounting angle dimensions
