General

Construction

- 1 Housing
- 2 Sliding piston
- 3 Compression spring
- 4 Set screw
- 5 Bleeding screw
- 6 Protective cap
- a Ring surface
- b Spring chamber
- c Bore hole
- d Diameter
- P Pressure connection
- T Tank connection

Description

The pressure relief valve SPV is a direct spring sliding piston valve. It is intended for mounting in pipelines and is suitable to safeguard low pressure hydraulic circuits.

The pipe connection is to be effected either by SAE mounting surfaces or by Whitworth pipe threads.

Notes

When using strongly aerated media, the valve should preferably be mounted vertical with the set screw facing down.

The tank connection T of the valve must not be exposed to underpressure when subject to flow, as in this case the valve cannot be ventilated, possibly resulting in unwanted vibrations and noise. If this cannot be avoided, version 3 „vibration-damped, with damping nozzle“ should be selected under item 10 in the type code.

Function

The sliding piston 2 is pressed against the annular surface a by the compression spring 3 and thus blocks the pressure connection P from the tank connection T via the diameter d. When the opening pressure, set by the adjusting screw 4, is reached, the sliding piston 2 releases the fluid flow to the tank connection. The spring chamber b is relieved through the hole c. When commissioning the valve, the spring chamber b must be vented using the bleeding screw 5. In order to achieve an optimum characteristic curve, the valves are available in several pressure stages for the respective pressure setting ranges.

Technical data

General characteristics

Nominal sizes	10 · 20 · 25 · 32 · 40 · 50 · 80
Types of construction	Slide valve – directly operated Seat valve Ball valve
Mounting types	Pipe installation Flange Panel installation
Hydraulic connections	Flange connection SAE (ISO 6162-1 / SAE J518) Pipe thread (ISO 228-1)
Mounting positions	Any, pressure adjustment screw at the bottom preferred
Pressure adjustment types	Mechanical, adjusting screw Mechanical, rotary handle
Pressure fluids	Hydraulic oils acc. to DIN 51 524/25 (other fluids on request)

Hydraulic characteristics

Nominal sizes	10	20	25	32	40	50	80

Explosion protection version (Atex)

Explosion protection – field of application for the pressure relief valves

The valve is used to secure low pressure hydraulic circuits with various flammable and non-flammable fluids.

They can be used:

1. In zone 2 (Gas-Ex, Category 3G)
in the explosion groups IIA, IIB and IIC
2. In zone 22 (Dust-Ex, Category 3D)
in the explosion groups IIIA and IIIB
3. In zone 1 (Gas-Ex, Category 2G)
in explosion groups IIA, IIB and IIC
4. In zone 21 (Dust-Ex, Category 2D)
in the explosion groups IIIA and IIIB

The qualification for the surface temperature is T4; for all gases, vapours, mists with an ignition temperature >135 °C, the operating materials are not an ignition source.

In the Dust-Ex area, 135 °C is the reference temperature for further considerations regarding the safety margin to the glow temperature, etc. (can only be decided by the operating company).

The permissible ambient temperature ranges from
-20 ... +60 °C (NBR, Copper, Soft iron)
-15 ... +60 °C (FKM)

Flashpoint, minimum ignition temperature and mediaspecific attributes must be complied with by the operating organisation.

Not allow any explosive mixture to be present inside the unit.

The permissible media temperature ranges from
-20 ... +80 °C (NBR, Copper, Soft iron)
-15 ... +80 °C (FKM)
